Waterford: Antimicrobial Guidelines - Antimicrobial Guideline: Appendix 1: South East Regional Orthopaedic Service Antibiotic Prophylaxis For Open Fractures

## Appendix 1: South East Regional Orthopaedic Service Antibiotic Prophylaxis For Open Fractures

## PHASE 1 : Within 1 hour of injury and continue until wound excision

Antibiotic Regimen should be administered as soon as possible after the injury:

- Cefuroxime 1.5 g IV TDS plus Metronidazole 500 mg IV TDS until time of first debridement.
- In case of IgE-mediated /severe penicillin allergy/anaphylaxis: Use Clindamycin 600mg-1.2g QDS IV plus Gentamicin 3mg/kg once daily
  IV. Patients with non-severe penicillin allergy (mild / rash only and no history of severe reaction / anaphylaxis / angioedema), a cephalosporin such as
  Cefuroxime is considered safe and is the agent of choice.
- In the case of open fractures of the distal phalanx of the finger use Cefuroxime 1.5g TDS IV only (in case of severe penicillin allergy/anaphylaxis use Clindamycin 600mg-1.2g QDS IV).
- If history or high risk of MRSA colonisation / infection add Vancomycin 15mg/kg (max 2g) to the antibiotic regimens.
- In the case of heavily contaminated wounds, e.g. farmyard injuries or injuries with vascular insufficiency or Gustilo Grade III fractures, add Gentamicin 3 mg/kg IV once daily to antibiotic regimen on initial presentation. At the time of first debridement and stabilisation, ensure prophylaxis of Cefuroxime 1.5 g IV and Metronidazole 500 mg IV is given; in addition give Gentamicin 3 mg/kg IV stat pre-operatively (unless Gentamicin has been given in the past 16 hours).
- · Antibiotics after wound excision should continue for 24 hours .

## PHASE 2:

 At the time of definitive skeletal stabilisation and definitive soft tissue coverage the patient should receive a single intravenous dose at induction of Vancomycin 15mg/kg (max 2g) (if it has been more than 12 hour since the last dose) plus Gentamicin 3 mg/ kg (if it has been more than 16 hours since the last dose).
